

# What Fred Berlin & Johns Hopkins' "Department Of Psychiatry And Behavior Sciences" Define as "Successful" Treatment Of Pedophiles And Sundry Child Molesters (1981)

Below is the Berlin & Coyle Johns Hopkins report on sex crime recidivism by Johns Hopkins sex offender clinic "patients." Of the 20 male sex criminals listed, 13 were child molesters. Of these, 4 were still "in treatment" leaving a test population of 9 child molesters. Of these, 3 (33%) allegedly did not "relapse" to "deviant behavior" *within 2 years* (see data at right of these same 20 criminals). Using these bizarre criteria of child "protection," only 3 (33%) of the 9 released molesters did not 'relapse' within a 2 year period (% of relapse after 2 years is not revealed). Were offenses committed at the same rate as admitted at incarceration, the 9 relapsed child molesters would have averaged roughly 32 child victims/crimes monthly or 384 child abuse crimes a year, 768 in their 2 year window (some may have been multiple abuses of the same child). Since sex criminals are not forced to inject Depo Provera weekly post their formal release, there is no guarantee that the "treated" molesters did not significantly *increase* their child abuse upon release.

Below: All Berlin/McHugh John Hopkins successes are based on a "1-year" margin to reported re-offense. Relapse occurs "less than 1 year" after treatment or "more than 1 year after treatment." Below is the time line in Berlin & Schaerf's "Lab Assessment of the Paraphilias" that explicates the Hopkins report on the same child molester population seen at left.

After treatment	
Treatment dropout; no relapse less than 1 year after treatment	Treatment dropout; relapsed less than 1 year after treatment
Treatment dropout; relapsed more than 1 year after treatment	Treatment dropout; relapsed less than 1 year after treatment
Treatment dropout; relapsed more than one year after treatment	Relapsed less than 1 year after treatment
Treatment continues; no relapses	Treatment continues; no relapses
Treatment dropout; relapsed less than 1 year after treatment	Treatment continues; no relapses
Treatment continues; no relapses	Treatment continues; no relapses
Relapsed less than 1 year after treatment; treatment now resumed	Treatment completed; no relapse more than 1 year after treatment
Treatment continues	Treatment continues
Treatment completed; no relapse less than 1 year after treatment	Treatment completed; no relapse less than 1 year after treatment
Treatment dropout; relapsed more than 1 year after treatment	Treatment dropout; relapsed more than 1 year after treatment
Treatment continues; in prison	Treatment continues; in prison
Relapsed	Relapsed
Treatment dropout; relapsed less than 1 year after treatment	Treatment dropout; relapsed less than 1 year after treatment
Treatment dropout; relapsed less than 1 year after treatment	Treatment dropout; relapsed less than 1 year after treatment
Treatment continues; no relapses	Treatment continues; no relapses

TABLE II  
Changes in Sexually Deviant Behaviors in 20 Chronic Paraphilic Male Patients Treated With Medroxyprogesterone Acetate\*

Patient	Diagnosis	Average frequency of sexually deviant behaviors before treatment†	Length of drug treatment‡	Occurrence of Deviant Behaviors	
				During treatment	After treatment
1	Homosexual pedophilia	once/week	5 years, 9 months	None	No relapse
2	Homosexual pedophilia	twice/month 1 known arrest	1 year	None	Relapsed
3	Heterosexual exhibitionism	2 times/week	10 months	None	Relapsed
4	Homosexual masochism	4 times/week	3 months	None	Relapsed
5	Bisexual pedophilia	2 times/week	3 months	None	Relapsed
6	Transvestism	7 times/week	1 year, 4 months	None	Relapsed
7	homosexual incest	2 known incidents			
	Heterosexual sadism	once every 2 weeks for 25 years	3 years, 5 months	None	Still in treatment
8	Homosexual pedophilia	2 times/week 6 arrests in 6 years	10 months	None	Relapsed
9	Homosexual pedophilia	Once every 2 months 4 arrests in 6 years	2 years	None	Still in treatment
10	Homosexual pedophilia	once/week 14 arrests in 29 years	3 years, 9 months	Relapsed	Treatment continues
11	Homosexual pedophilia	2 times/week 7 known arrests	4 years, 2 months	None	Still in treatment
12	Voyeurism	2 times/week (pedophilia)	5 years, 3 months	None	Relapsed
13	heterosexual pedophilia	5-8 arrests			
14	Homosexual pedophilia	2 times/week since age 10	5 years, 9 months	None	No relapse
	Homosexual pedophilia	once/month numerous arrests, 4 convictions, 4 parole violations	3 years, 8 months	Relapsed	Treatment continues
15	Homosexual pedophilia, exhibitionism	probably several incidents/year	3 years, 9 months	None	No relapse
16	Homosexual pedophilia	once/week	1 year, 1 month	None	Relapsed
17	Heterosexual voyeurism	once/month	1 year	Relapsed (while intoxicated)	Treatment continues (in prison)
18	Heterosexual exhibitionism	5 times/day since age 11	2 years, 2 months	None	Relapsed
19	Heterosexual exhibitionism	numerous arrests			
20	Heterosexual exhibitionism	2 times/week	2 years, 1 month	None	Relapsed
	Heterosexual exhibitionism	4 times/week binges of 20/day	2 years, 3 months	None	Still in treatment

Adapted from Reference 10.  
\* Deviant behavior was considered to have occurred if the patient was accused of having it, or admitted to it, even if it did not come to the attention of the law.  
† Based on institutional records and patients' statements.  
‡ Patients who stopped medication did so against advice, except in the cases of patients 13 and 15.
